1. An apparatus for processing a signal, comprising:

a signal dispensing unit for dispensing an output signal output from a personal computer in the form of an analog or digital signal;

a signal processing unit for performing picture-in-picture signal processing enabling one of a digital personal computer signal generated by the signal dispensing unit and a decoded first signal input from an outside source to be displayed on a main screen and the other to be displayed on at least one sub-screen, and for processing the first signal to be displayed alone on the main screen, the first signal being any one of a television signal and a video signal;

an outputting unit for outputting an analog personal computer signal generated from the signal dispensing unit in response to a control signal for displaying only the personal computer signal, and outputting an output signal of the signal processing unit in response to a control signal for displaying the picture-in-picture and first signals; and

a monitor for amplifying the signal output from the outputting unit to be displayed.

- 2. The apparatus of claim 1, further comprising a signal conversion unit for converting the picture-in-picture signal output from the signal processing unit into an analog signal before a signal is output from the outputting unit.
 - 3. The apparatus of claim 1, with the signal processing unit, comprising:

a decoding unit converting the first signal into a digital signal and decoding the first signal;

a scan rate conversion unit for converting a scan rate of the decoded first signal; and

a signal processing unit for performing a picture-in-picture signal process on the first signal whose scan rate is converted and the digital personal computer signal, so that one of the first signal and the digital personal computer signal is displayed on the main screen and the other of the first signal and the digital personal computer signal is displayed on the plurality of sub-screens, or for processing the first signal to be displayed alone on the main screen.

4. The apparatus of claim 1, with the decoded first signal input from an outside source, further comprising:

a decoding unit converting the first signal into a digital signal and decoding the first signal; and

a scan rate conversion unit for converting a scan rate of the decoded first signal.

- 5. The apparatus of claim 2, with the decoded first signal input from an outside source, further comprising:
- a decoding unit converting the first signal into a digital signal and decoding the first signal;
- and
- a scan rate conversion unit for converting a scan rate of the decoded first signal.

6. A method for processing a signal, comprising the steps of:

dispensing an output signal output from a personal computer in the form of an analog or digital signal;

performing picture-in-picture signal processing enabling one of a digital personal computer signal generated by the step of dispensing the output signal and a decoded first signal input from an outside source to be displayed on a main screen and the other to be displayed on at least one subscreen, and for processing the first signal to be displayed alone on the main screen, the first signal being any one of a television signal and a video signal;

outputting an analog personal computer signal generated from the step of dispensing an output signal in response to a control signal for displaying only the personal computer signal, and outputting an output signal of the step of performing picture-in-picture signal processing in response to a control signal for displaying the picture-in-picture and first signals;

amplifying the signal output from the step of outputting the analog personal computer signal;

displaying the amplified signal output.

7. The method of claim 6, further comprising the step of converting the picture-in-picture signal output from the step of performing picture-in-picture signal processing into an analog signal before a signal is output from the step of outputting the analog personal computer signal.

an outputting unit outputting the output signal of the personal computer signal generated

3

from the signal dispensing unit in response to a control signal for displaying only the personal computer signal, and outputting an output signal of the signal processing unit in response to a control signal for displaying the picture-in-picture and video signals; and

a monitor amplifying and displaying the signal output from the outputting unit.

- The apparatus of claim 10, further comprising a signal conversion unit for converting the picture-in-picture signal output from the signal processing unit from a digital signal into an analog signal before a signal is output from the outputting unit.
- 12. The apparatus of claim 10, with the decoded video signal input from an outside source, further comprising:
- a decoding unit converting the video signal into a digital signal and decoding the video signal; and
 - a scan rate conversion unit for converting a scan rate of the decoded video signal.
- 13. The apparatus of claim 12, with the decoded video signal input from an outside source, further comprising:
- a decoding unit converting the video signal into a digital signal and decoding the video signal; and
 - a scan rate conversion unit for converting a scan rate of the decoded video signal.

- 14. The apparatus of claim 10, further comprised of the video signal being selected from the group consisting of a television video signal and a non-broadcasted video signal.
 - 15. The apparatus of claim 10, further comprising:
- an analog to digital converter unit converting the output signal from the signal dispensing unit from an analog signal into a digital signal for the signal processing unit; and
- a digital to analog converter unit converting the output signal generated from the signal dispensing unit from a digital signal into an analog signal for the outputting unit.
